

CISC / CMPE 327, Fall 2019  
**Course Project Assignment #2: Front End Rapid Prototype**

In this assignment, you will design and rapidly program the first prototype of your team's Front End, **with all features**. Since the **next** assignment will involve running your Requirements Tests from Assignment #1, **do not do full testing** of your Front End at this time (no marks are for correctness yet!). Try to work together on your program using Pair Programming, where one of you advises on the higher-level design issues while the other does the coding.

Deliveries:

- (1) A **design document in PDF format** for your Front End, giving the overall structure of your solution, showing the classes and methods as a diagram or table, with a brief (one sentence) description of the intention of each.
- (2) The **first version of the source code** to implement your design (including all features of the Front End). This version should run on at least some manual inputs but should not yet be completely tested with requirement tests from Assignment #1 (since that will be the next assignment, and it's better to leave some failures until then). The front-end should take **two** command-line arguments:

`frontend your_account_list_file.txt your_transaction_summary.txt`

Your solution to this assignment will be judged on the **clarity** and **readability** of the design and the code, so work at using your best programming practices, including naming variables, classes and methods meaningfully, and commenting liberally to make it easy for other programmers to understand.

Your solution to this assignment will **not** be judged on its correctness; rather, on the **quality of its design and coding**. This is to be a rapid first version, not a final product. So, design and program it to work correctly, but don't worry about getting it fully tested or debugged yet, since that's what you will do on the next assignment.

► **Please following our GitHub submission instruction to submit this assignment** ◀

**Marking Criteria:** Marks will be assigned between zero and the number of marks shown, to a resolution of 1/2 mark.

Design	(Primarily in the design document)	4 marks
Architecture		
<ul style="list-style-type: none"><li>• clearly documents structure of solution</li><li>• explicitly describes intention of each class and method</li><li>• accurately reflects solution structure</li><li>• clearly shows where inputs and outputs fit in</li></ul>		
Completeness		
<ul style="list-style-type: none"><li>• evidently addresses all required functionality (solution has parts to address all required operations and results)</li><li>• has specified inputs, outputs and files (only!): Front End takes in transactions on standard input, produces messages on standard output, has one input file (Valid Accounts List), and one output file (Transaction Summary)</li></ul>		
Source Code	(Details of the source code itself)	4 marks
Structure and format		
<ul style="list-style-type: none"><li>• code is structured and formatted such that architecture is clearly visible in code</li><li>• naming of classes and methods clearly reflect their role in the solution</li><li>• as little cloning or redundancy as possible</li></ul>		
Maintainability		
<ul style="list-style-type: none"><li>• avoidance of coding tricks and hacks</li><li>• simplest solution possible, no frills and extras</li><li>• clearest solution possible, no gratuitous optimizations</li></ul>		
Internal documentation		
<ul style="list-style-type: none"><li>• clear naming of all variables and constants to reflect their role in the solution</li><li>• comments for every class and method, clearly documenting their interface and intention</li><li>• comment at beginning of main program, documenting: overall program intention, input and output files, how the program is intended to be run</li></ul>		
Overall Presentation & Quality		2 marks
<b>Total</b>		<b>10 marks</b>
